                                                AROUND THE FIRST THREE RST 7 LOCATIONS
                                                DURING RST 6 EXECUTION. RST 7 INITIALLY
                                                CONTAINS A RET, BUT THE USER CAN CHANGE IT TO
                                                A JMP TO AN INTERRUPT SERVICE ROUTINE.

                                FUNCTION DISPATCH ADDRESSES
                                        FUNDSP CONTAINS THE ADDRESSES OF THE
                                        FUNCTION ROUTINES IN THE ORDER OF THE
                                        FUNCTION NAMES IN THE CRUNCH LIST.
                                        THE FUNCTIONS THAT TAKE MORE THAN ONE ARGUMENT
                                        ARE AT THE END. SEE THE EXPLANATION AT ISFUN.

                                THE OPERATOR TABLE
                                        THE OPTAB TABLE CONTAINS AN OPERATORS PRECEDENCE
                                        FOLLOWED BY THE ADDRESS OF THE ROUTINE TO PERFORM
                                        THE OPERATION. THE INDEX INTO THE
                                        OPERATOR TABLE IS MADE BY SUBTRACTING OFF THE CRUNCH VALUE
                                        OF THE LOWEST NUMBERED OPERATOR. THE ORDER
                                        OF OPERATORS IN THE CRUNCH LIST AND IN OPTAB IS IDENTICAL.
                                        THE PRECEDENCES ARE ARBITRARY,EXCEPT FOR THEIR
                                        COMPARATIVE SIZES. NOTE THAT THE PRECEDENCE FOR
                                        UNARY OPERATORS SUCH AS NOT AND NEGATION ARE
                                        SETUP SPECIALLY WITHOUT USING A TABLE.

                                THE RESERVED WORD OR CRUNCH LIST
                                        WHEN A COMMAND OR PROGRAM LINE IS TYPED IN
                                        IT IS STORED IN BUF. AS SOON AS THE WHOLE LINE
                                        HAS BEEN TYPED IN (INLIN RETURNS) CRUNCH IS
                                        CALLED TO CONVERT ALL RESERVED WORDS TO THEIR
```

```
                                        CRUNCH VALUES. THIS REDUCES THE SIZE OF THE
                                        PROGRAM AND SPEEDS UP EXECUTION BY ALLOWING
                                        TABLE DISPATCHES TO PERFORM FUNCTIONS,STATEMENTS,
                                        AND OPERATIONS. THIS IS BECAUSE ALL THE STATEMENT
                                        NAMES ARE STORED CONSECUTIVELY IN THE CRUNCH LIST,
                                        WHEN A MATCH IS FOUND BETWEEN A STRING
                                        OF CHARACTERS AND A WORD IN THE CRUNCH LIST
                                        THE ENTIRE TEXT OF THE MATCHED WORD IS TAKEN OUT OF
                                        THE INPUT LINE AND A RESERVED WORD TOKEN IS PUT
                                        IN ITS PLACE. A RESERVED WORD TOKEN IS ALWAYS EQUAL
                                        TO OCTAL 200 PLUS THE POSITION OF THE MATCHED WORD
                                        IN THE CRUNCH LIST.

                                STATEMENT DISPATCH ADDRESSES
                                        WHEN A STATEMENT IS TO BE EXECUTED, THE FIRST
                                        CHARACTER OF THE STATEMENT IS EXAMINED
                                        TO SEE IF IT IS LESS THAN THE RESERVED
                                        WORD TOKEN FOR THE LOWEST NUMBERED STATEMENT NAME.
                                        IF SO, THE "LET" CODE IS CALLED TO
                                        TREAT THE STATEMENT AS AN ASSIGNMENT STATEMENT.
                                        OTHERWISE A CHECK IS MADE TO MAKE SURE THE
                                        RESERVED WORD NUMBER IS NOT TOO LARGE TO BE A
                                        STATEMENT TYPE NUMBER. IF NOT THE ADDRESS
                                        TO DISPATCH TO IS FETCHED FROM STMDSP (THE STATEMENT
                                        DISPATCH TABLE) USING THE RESERVED WORD
                                        NUMBER FOR THE STATEMENT TO CALCULATE AN INDEX INTO
                                        THE TABLE.

                                ERROR MESSAGES
                                        WHEN AN ERROR CONDITION IS DETECTED
                                        (E) MUST BE SET UP TO INDICATE WHICH ERROR
                                        MESSAGE IS APPROPRIATE AND A BRANCH MUST BE MADE
                                        TO ERROR. THE STACK WILL BE RESET AND ALL
                                        PROGRAM CONTEXT WILL BE LOST. VARIABLES
                                        VALUES AND THE ACTUAL PROGRAM REMAIN INTACT.
                                        ONLY THE VALUE OF (E) IS IMPORTANT WHEN
                                        THE BRANCH IS MADE TO ERROR. (E) IS USED AS AN
                                        INDEX INTO ERRTAB WHICH GIVES THE TWO
                                        CHARACTER ERROR MESSAGE THAT WILL BE PRINTED ON THE
                                        USER'S TERMINAL.

                                IMPURE STORAGE
                                        ALL TEMPORARIES,FLAGS,POINTERS, THE BUFFER AREA,
                                        THE FLOATING ACCUMULATOR,AND ANYTHING ELSE THAT
                                        IS USED TO STORE A CHANGING VALUE SHOULD BE LOCATED
                                        IN THIS AREA. CARE MUST BE MADE IN MOVING LOCATIONS
                                        IN THIS AREA SINCE THE JUXTAPOSITION OF TWO LOCATIONS
                                        IS OFTEN DEPENDED UPON.

                                        CONSTANT MESSAGES ARE STORED HERE, UNLESS
                                        THE CODE TO CHECK IF A STRING MUST BE COPIED
                                        IS CHANGED THESE STRINGS MUST BE STORED ABOVE
```

```
                                05020                   DSCTMP, OR ELSE THEY WILL BE COPIED BEFORE
                                05040                   THEY ARE PRINTED.
                                05080           FNDFOR
                                05100                   MOST SMALL ROUTINES ARE FAIRLY SIMPLE
                                05120                   AND ARE DOCUMENTED IN PLACE, FNDFOR IS
                                05140                   USED FOR FINDING "FOR" ENTRIES ON
                                05160                   THE STACK, WHENEVER A "FOR" IS EXECUTED AN
                                05180                   18 BYTE ENTRY IS PUSHED ONTO THE STACK.
                                05200                   BEFORE THIS IS DONE, HOWEVER, A CHECK
                                05220                   MUST BE MADE TO SEE IF THERE
                                05240                   ARE ANY "FOR" ENTRIES ALREADY ON THE STACK
                                05260                   FOR THE SAME LOOP VARIABLE, IF SO, THAT "FOR" ENTRY
                                05280                   AND ALL OTHER "FOR" ENTRIES THAT WERE MADE AFTER IT
                                05300                   ARE ELIMINATED FROM THE STACK, THIS IS SO A
                                05320                   PROGRAM THAT JUMPS OUT OF THE MIDDLE
                                05340                   OF A "FOR" LOOP AND THEN RESTARTS THE LOOP AGAIN
                                05360                   AND AGAIN WON'T USE UP 18 BYTES OF STACK
                                05380                   SPACE EVERY TIME, THE "NEXT" CODE ALSO
                                05400                   CALLS FNDFOR TO SEARCH FOR A "FOR" ENTRY WITH
                                05420                   THE LOOP VARIABLE IN
                                05440                   THE "NEXT", AT WHATEVER POINT A MATCH IS FOUND
                                05460                   THE STACK IS RESET, IF NO MATCH IS FOUND A
                                05480                   "NEXT WITHOUT FOR"  ERROR OCCURS, GOSUB EXECUTION
                                05500                   ALSO PUTS A 6 BYTE ENTRY ON STACK,
                                05520                   WHEN A RETURN IS EXECUTED FNDFOR IS
                                05540                   CALLED WITH A VARIABLE POINTER THAT CAN'T
                                05560                   BE MATCHED, WHEN "FNDFOR" HAS RUN
                                05580                   THROUGH ALL THE "FOR" ENTRIES ON THE STACK
                                05600                   IT RETURNS AND THE RETURN CODE MAKES
                                05620                   SURE THE ENTRY THAT WAS STOPPED
                                05640                   ON IS A GOSUB ENTRY, THIS ASSURES THAT
                                05660                   IF YOU GOSUB TO A SECTION OF CODE
                                05680                   IN WHICH A FOR LOOP IS ENTERED BUT NEVER
                                05700                   EXITED THE RETURN WILL STILL BE
                                05720                   ABLE TO FIND THE MOST RECENT
                                05740                   GOSUB ENTRY, THE "RETURN" CODE ELIMINATES THE
                                05760                   "GOSUB" ENTRY AND ALL "FOR" ENTRIES MADE AFTER
                                05780                   THE GOSUB ENTRY.

                        'A' WITH 'AS' OR 'AS' WITH 'A', THE MEANING OF
                        THE FOUR VALUE BYTES ARE:
                                LOW
                                        LENGTH OF THE STRING
                                        UNUSED
                                        LOW 8 BITS
                                        HIGH 8 BITS OF THE ADDRESS
                                            OF THE CHARACTERS IN THE
                                            STRING IF LENGTH.NE.0.
                                            MEANINGLESS OTHERWISE.
                                HIGH
                        THE VALUE OF A STRING VARIABLE (THESE 4 BYTES)
                        IS CALLED THE STRING DESCRIPTOR TO DISTINGUISH
                        IT FROM THE ACTUAL STRING DATA, WHENEVER A
                        STRING CONSTANT IS ENCOUNTERED IN A FORMULA OR AS
                        PART OF AN INPUT STRING, OR AS PART OF DATA, STRLIT
                        IS CALLED, CAUSING A DESCRIPTOR TO BE BUILT FOR
                        THE STRING. IF THE STRING CONSTANT IS IN BUF (WHICH
                        IT WILL BE IF THE STRING IS BEING "INPUT", OR THE
                        STRING IS PART OF SOME FORMULA IN A DIRECT STATEMENT)
                        THE VALUE IS COPIED INTO STRING SPACE SINCE BUF
                        IS ALWAYS CHANGING, "STKCPY" IS USED TO COPY
                        STRINGS.

                        STRING FUNCTIONS AND THE ONE STRING OPERATOR "+"
                        ALWAYS RETURN THEIR VALUES IN STRING SPACE,
                        ASSIGNING A STRING A CONSTANT VALUE IN A PROGRAM
                        THROUGH A "READ" OR ASSIGNMENT STATEMENT
                        WILL NOT USE ANY STRING SPACE SINCE
                        THE STRING DESCRIPTOR WILL POINT INTO THE
                        PROGRAM ITSELF. IN GENERAL, COPYING IS DONE
                        WHEN A STRING VALUE IS IN BUF, OR IT IS IN STRING
                        SPACE AND THERE IS AN ACTIVE POINTER TO IT.
                        THUS F$=G$ WILL CAUSE COPYING IF G$ HAS ITS
                        STRING DATA IN STRING SPACE. F$=CHR$(7)
                        WILL USE ONE BYTE OF STRING SPACE TO STORE THE
                        NEW ONE CHARACTER STRING CREATED BY "CHR$", BUT
                        THE ASSIGNMENT ITSELF WILL CAUSE NO COPYING SINCE
                        THE ONLY POINTER AT THE NEW STRING IS A
                        TEMPORARY DESCRIPTOR CREATED BY FRMEVL WHICH WILL
                        GO AWAY AS SOON AS THE ASSIGNMENT IS DONE.
                        IT IS THE NATURE OF GARBAGE COLLECTION THAT
                        DISALLOWS HAVING TWO STRING DESCRIPTORS POINT TO THE SAME
                        AREA IN STRING SPACE, STRING FUNCTIONS AND OPERATORS
                        MUST PROCEED AS FOLLOWS:
                                1) FIGURE OUT THE LENGTH OF THEIR RESULT
                                2) CALL GETSPA TO FIND SPACE FOR THEIR
                                RESULT, THE ARGUMENTS TO THE FUNCTION
                                OR OPERATOR MAY CHANGE SINCE GARBAGE COLLECTION
                                MAY BE INVOKED. THE ONLY THING THAT CAN
                                BE SAVED DURING THE CALL TO GETSPA IS A POINTER
                                TO THE DESCRIPTORS OF THE ARGUMENTS.
                                3) CONSTRUCT THE RESULT DESCRIPTOR IN DSCTMP.

```

```
                                GETSPA RETURNS THE LOCATION OF THE AVAILABLE
                                SPACE.
                                4) CREATE THE NEW VALUE BY COPYING PARTS
                                OF THE ARGUMENTS OR WHATEVER.
                                5) FREE UP THE ARGUMENTS BY CALLING FRETMP.
                                6) JUMP TO PUTNEW TO GET THE DESCRIPTOR IN
                                DSCTMP TRANSFERRED INTO A NEW STRING TEMPORARY.

                        THE REASON FOR STRING TEMPORARIES IS THAT GARBAGE
                        COLLECTION HAS TO KNOW ABOUT ALL ACTIVE STRING DESCRIPTORS
                        SO IT KNOWS WHAT IS AND ISN'T IN USE. STRING TEMPORARIES ARE
                        USED TO STORE THE DESCRIPTORS OF STRING EXPRESSIONS.

                        INSTEAD OF HAVING AN ACTUAL VALUE STORED IN THE
                        FAC, AND HAVING THE VALUE OF A TEMPORARY RESULT
                        BEING SAVED ON THE STACK, AS HAPPENS WITH NUMERIC
                        VARIABLES, STRINGS HAVE THE POINTER TO A STRING DESCRIPTOR
                        STORED IN THE FAC, AND IT IS THIS POINTER
                        THAT GETS SAVED ON THE STACK BY FORMULA EVALUATION.
                        STRING FUNCTIONS CANNOT FREE THEIR ARGUMENTS UP RIGHT
                        AWAY SINCE GETSPA MAY FORCE
                        GARBAGE COLLECTION AND THE ARGUMENT STRINGS
                        MAY BE OVER-WRITTEN SINCE GARBAGE COLLECTION
                        WILL NOT BE ABLE TO FIND AN ACTIVE POINTER TO
                        THEM. FUNCTION AND OPERATOR RESULTS ARE BUILT IN
                        DSCTMP SINCE STRING TEMPORARIES ARE ALLOCATED
                        (PUTNEW) AND DEALLOCATED (FRETMP) IN A FIFO ORDERING
                        (I.E., A STACK) SO THE NEW TEMPORARY CANNOT
                        BE SET UP UNTIL THE OLD ONE(S) ARE FREED, TRYING
                        TO BUILD A RESULT IN A TEMPORARY AFTER
                        FREEING UP THE ARGUMENT TEMPORARIES COULD RESULT
                        IN ONE OF THE ARGUMENT TEMPORARIES BEING OVERWRITTEN
                        TOO SOON BY THE NEW RESULT.

                        STRING SPACE IS ALLOCATED AT THE VERY TOP
                        OF MEMORY, MEMSIZ POINTS BEYOND THE LAST LOCATION OF
                        STRING SPACE, STRING ARE STORED IN HIGH LOCATIONS
                        FIRST. WHENEVER STRING SPACE IS ALLOCATED (GETSPA)
                        FRETOP, WHICH IS INITIALIZED TO (MEMSIZ), IS UPDATED
                        TO GIVE THE HIGHEST LOCATION IN STRING SPACE
                        THAT IS NOT IN USE, THE RESULT IS THAT
                        FRETOP GETS SMALLER AND SMALLER, UNTIL SOME
                        ALLOCATION WOULD MAKE (FRETOP) LESS THAN OR EQUAL TO
                        (STKTOP). THIS MEANS STRING SPACE HAS RUN INTO THE
                        STACK AND THAT GARBAGE COLLECTION MUST BE CALLED.

                        GARBAGE COLLECTION:
                                0. MINPTR=(STKTOP) (FRETOP)=(MEMSIZ)
                                1. REMMIN=0
                                2. FOR EACH STRING DESCRIPTOR
                                (TEMPORARIES, SIMPLE STRINGS, STRING ARRAYS)
                                IF THE STRING IS NOT NULL AND ITS POINTER IS
                                .GT.MINPTR AND .LT.FRETOP,
```

```
                                        MINPTR=THIS STRING DESCRIPTORS POINTER
                                        REMMIN=POINTER AT THIS STRING DESCRIPTOR
                                        END
                                        3, IF REMMIN,NE,0 (WE FOUND AN UNCOLLECTED STRING)
                                        BLOCK TRANSFER THE STRING DATA POINTED
                                        TO IN THE STRING DESCRIPTOR POINTED TO BY REMMIN
                                        SO THAT THE LAST BYTE OF STRING DATA IS AT
                                        (FRETOP), UPDATE FRETOP SO THAT IT
                                        POINTS TO THE LOCATION JUST BELOW THE ONE
                                        THE STRING DATA WAS MOVED INTO, UPDATE
                                        THE POINTER IN THE DESCRIPTOR SO IT POINTS
                                        TO THE NEW LOCATION OF THE STRING DATA,
                                        GO TO STEP 1,

                                AFTER CALLING GARBAGE COLLECTION GETSPA AGAIN CHECKS
                                TO SEE IF [A] CHARACTERS ARE AVAILABLE BETWEEN
                                (STKTOP) AND (FRETOP) , IF NOT AN "OUT OF STRING"
                                ERROR IS INVOKED,

```

```
                                01380
                                01400   THE FLOATING POINT FORMAT IS AS FOLLOWS:
                                01420
                                01440   THE SIGN IS THE FIRST BIT OF THE MANTISSA
                                01460   THE MANTISSA IS 24 BITS LONG
                                01480   THE BINARY POINT IS TO THE LEFT OF THE MSB
                                01500   NUMBER = MANTISSA * 2 ^ EXPONENT
                                01520   THE MANTISSA IS PUSITIVE, WITH A ONE ASSUMED TO BE WHERE THE SIGN BIT IS
                                01540   THE SIGN OF THE EXPONENT IS THE FIRST BIT OF THE EXPONENT
                                01560   THE EXPONENT IS STORED IN EXCESS 200 I.E. WITH A BIAS OF 200
                                01580   SO, THE EXPONENT IS A SIGNED 8-BIT NUMBER WITH 200 ADDED TO IT
                                01600   AN EXPONENT OF ZERO MEANS THE NUMBER IS ZERO, THE OTHER BYTES ARE IGNORED
                                01620   TO KEEP THE SAME NUMBER IN THE FAC WHILE SHIFTING:
                                01640           TO SHIFT RIGHT, EXP:=EXP+1
                                01660           TO SHIFT LEFT,  EXP:=EXP-1
                                01680
                                01700   SO, IN MEMORY THE NUMBER LOOKS LIKE THIS:
                                01720           (BITS 17-24 OF THE MANTISSA)
                                01740           (BITS 9-16 OF THE MANTISSA)
                                01760           (THE SIGN IN BIT 7, BITS 2-8 OF THE MANTISSA ARE IN BITS 6-0)
                                02000           (THE EXPONENT AS A SIGNED NUMBER + 200)
                                02020   (REMEMBER THAT BIT 1 OF THE MANTISSA IS ALWAYS A ONE)
                                02040
                                02060   ARITHMETIC ROUTINE CALLING CONVENTIONS:
                                02080
                                02100   FOR ONE ARGUMENT FUNCTIONS:
                                02120           THE ARGUMENT IS IN THE FAC, THE RESULT IS LEFT IN THE FAC
                                02140   FOR TWO ARGUMENT OPERATIONS:
                                02160           THE FIRST ARGUMENT IS IN B,C,D,E I.E, THE "REGISTERS"
                                02180           THE SECOND ARGUMENT IS IN THE FAC
                                02200           THE RESULT IS LEFT IN THE FAC
                                02220
                                02240   THE "S" ENTRY POINTS TO THE TWO ARGUMENT OPERATIONS HAVE (HL) POINTING TO
                                02260   THE FIRST ARGUMENT INSTEAD OF THE FIRST ARGUMENT BEING IN THE REGISTERS,
                                02280   MOVRM IS CALLED TO GET THE ARGUMENT IN THE REGISTERS.
                                02300   THE "T" ENTRY POINTS ASSUME THE FIRST ARGUMENT IS ON THE STACK,
                                02320   POPR IS USED TO GET THE ARGUMENT IN THE REGISTERS,
                                02340   NOTE: THE "T" ENTRY POINTS SHOULD ALWAYS BE JUMPED TO AND NEVER CALLED
                                02360   BECAUSE THE RETURN ADDRESS ON THE STACK WILL BE CONFUSED WITH THE NUMBER,
                                02380
                                02400   ON THE STACK, THE TWO LO'S ARE PUSHED ON FIRST AND THEN THE MO AND SIGN,
                                02420   THIS IS DONE SO IF A NUMBER IS STORED IN MEMORY, IT CAN BE PUSHED ON THE
                                02440   STACK WITH TWO PUSHM'S.  THE LOWER BYTE OF EACH PAIR IS IN THE LOWER
                                02460   MEMORY ADDRESS SO WHEN THE NUMBER IS POPPED INTO THE REGISTERS, THE HIGHER
                                02480   ORDER BYTE WILL BE IN THE HIGHER ORDER REGISTER OF THE REGISTER PAIR, I.E,
                                02500   THE HIGHER ORDER BYTE WILL BE POPPED INTO B, D OR H.
                                02520   %
